HTS-Microplates

1. Standard Microplate Footprint

The manufacture of user-friendly products is one of our most important goals. All microplates manufactured by Greiner Bio-One have a uniform footprint (Fig. 1) which is conform to the recommendation of the American National Standards Institute (ANSI 1-2004). For detailed information about the external dimensions of our microplates and the conformity with ANSI standards, please visit our website: www.gbo.com/bioscience/technical_information - or ask for data sheets and customer drawings. For further information about ANSI standards, please visit the society's website: www.slas.org.

Figure 1:
Footprint and tolerances of standard microplates

2. Material

Polypropylene (PP) and **polystyrene** (PS) are the standard materials used to manufacture the majority of microplates. Polystyrene is a highly clear polymer with excellent optical properties which makes it ideal for precise optical measurements. Polystyrene is also characterised by its ability to bind biomolecules, such as proteins, and it is therefore often used for manufacturing immunological products. Polystyrene is suitable for work with cell cultures.

Polypropylene is characterised by its excellent chemical and thermal stability. It is the ideal polymer for storage vessels or microplates. Polar molecules, such as proteins or DNA, are binding less to polypropylene than to polystyrene.

In addition to polystyrene and polypropylene microplates, Greiner Bio-One manufactures microplates with special requirement profiles, such as the UV-Star® microplates made from different **polyolefins**. These polyolefins are characterised by their low level of autofluorescence (Fig. 2), exceptionally high clarity, especially in the UV range (Fig. 3), and greater chemical stability when compared with polystyrene. A listing of chemical compatibilities of the main polymers used (→ Technical Appendix) can be found in Greiner Bio-One forum No. 3 or on our website www.gbo.com/bioscience.

Figure 2:
More than 100 x lower autofluorescence of the UV-Star® polyolefin compared with polystyrene

Figure 3:
Light transmission in the UV range. Comparison of polystyrene/polyolefins

3. µClear® and UV-Star®

The move from isotopic to non-isotopic assays (fluorescence/ luminescence), and new applications in high-throughput and high-content screening increased the demand for clear bottom plates, microplates with pigmented walls and thin film bottoms.

Up to now, clear bottom microplates have mostly been manufactured using a two-component injection moulding procedure by sticking or welding the components together. The development of a completely new and patented processing technique has made it possible for us to produce microplates with ultra-thin films, without the use of adhesives or solvents – the µClear® and UV-Star® products. This special method eradicates the risk of leaking wells (Fig. 4).

Figure 4:
Wells filled with methylene blue after threefold freezing and thawing:
a) single well of a Greiner Bio-One UV-Star® microplate
b) single well of a 96 well UV-transparent microplate of a competitor

The choice of suitable films is the decisive factor, and this will influence the quality of a clear bottom microplate. Strict controls before and during production guarantee a constant quality. Polarised light is either not depolarised (UV-Star®) or is only depolarised to a slight degree (µClear®) and the autofluorescence of the microplates is minimised (Fig. 5).

Figure 5:
Autofluorescence of different 384 well microplates at an excitation wavelength of 485 nm

The 96 well µClear® microplates and 384 well µClear® microplates have a film thickness of 190 µm +/- 20 µm. In the 1536 well microplates with a transparent bottom (µClear®) the film thickness is 75 µm +/- 10 µm. UV-Star® microplates generally have a film thickness of 135 µm +/- 10 µm.

4. Black or White?

White microplates are usually used for luminescence measurements (e.g. Luciferase Reporter Assays) and black microplates for fluorescence measurements (e.g. Green Fluorescence Protein). The critical properties in these methods, such as background, autofluorescence or crosstalk are considerably improved by the use of black or white pigmented microplates. The optical and physical properties of the Greiner Bio-One microplates were investigated in our laboratory. Higher pigment concentrations produced a much lower autofluorescence of the microplates. At shorter wavelengths, this influence is more pronounced than at the normal fluorescein wavelength combination of 485/520 nm (Fig. 6, 7). When comparing different white fractions, the same results were obtained for phosphorescence.

Figure 6:
Influence of the black pigment fraction and the wavelength used on the autofluorescence of 96 well microplates

Figure 7:
Influence of different black pigments on the autofluorescence of 96 well microplates

5. MICROLON®, FLUOTRAC™, LUMITRAC™

MICROLON®, FLUOTRAC™, and LUMITRAC™ stand for the quality of our immunology products. MICROLON® are clear microplates for transmission measurements. FLUOTRAC™ are black microplates for fluorescence measurements. LUMITRAC™ are white microplates for luminescence measurements. MICROLON® 600, FLUOTRAC™ 600 and LUMITRAC™ 600 are high binding polystyrene surfaces that have been specifically treated to provide an increased protein binding. MICROLON® 200, FLUOTRAC™ 200 and LUMITRAC™ 200 are medium binding (med. binding) polystyrene surfaces. The polystyrene surface of a medium binding microplate is more hydrophobic than the surface of a high binding microplate, and therefore tends to be more suitable for non-polar proteins and peptides. The consistency and reproducibility of our immunology products is constantly evaluated using an ELISA (Fig. 8).

Figure 8:
Fluorescence ELISA

In general, high binding microplates are recommended for ELISAs. The protein binding to the polystyrene surface can vary greatly and depends, among other things, on properties such as charge or size. When developing a new assay, it is therefore advisable to compare high binding and medium binding microplates in advance (→ see chapter 3).

We will be glad to supply samples for evaluation.

6. Non-binding Surfaces

Non-binding surfaces from Greiner Bio-One are characterised by their low binding capacity for biomolecules such as DNA, RNA, peptides and proteins. The repellent property of the non-binding surfaces for biomolecules can be advantageous in biochemical assays by increasing the sensitivity, reducing the background and improving the signal-to-noise ratio.

Achieved through a chemical modification of the resin rather than a resin mixture with potential to leach, the non-binding surface from Greiner Bio-One is stable under common assay conditions and does not degrade during short-term storage. The complete portfolio of non-binding microplates can be found on p. 2 | 30 ff.

7. Cell Culture Products / CELLSTAR® / TC

The polystyrene surface of an untreated microplate is hydrophobic and does not offer adherent cell lines a surface conducive to growth. Cell culture microplates from the CELLSTAR® range are specifically treated. This treatment leads to polar groups, such as carboxy and hydroxy groups, being incorporated into the plastic surface, making it hydrophilic. This significantly improves the adhesion of cells and the binding of proteins to the plastic surface. CELLSTAR® products are consistently evaluated using different cell lines.
Cell culture treated microplates → chapter 1.

8. Lids for Microplates (→ chapter 12)

Four different polystyrene lid designs are available:

- ☞ High profile lids
- ☞ High profile lids with condensation rings
- ☞ Low profile lids
- ☞ Ultra low profile lids

Lids are available in two options, sterile and non-sterile. If microplates are supplied with lids, as in the case of CELLSTAR® products, the 96 well microplates always include lids with a high profile (“lid, high profile”) and the 384 well microplates always include plate lids with a low profile (“lid, low profile”). In addition all products are also available without lids, which means that the type of lid can be selected as required.

Greiner Bio-One microplates:

- Are manufactured under DIN ISO 9001 guidelines
- Can be traced all the way back to production through a defined LOT number system
- Footprint compatible with automated systems
- Are free of detectable endotoxins (0.03 EU/ml) and regularly tested using an FDA-approved kinetic turbidimetric LAL-test (Limulus Amoebocyte Assay)
- Are analysed for detectable DNase, RNase and human DNA (→ Quality p. V)
- Are manufactured without the use of silicon-based mould release
- Are free of biozides and antistatics
- Are manufactured out of raw materials tested for leachables
- Barcode-labelling on request (→ p. 14 | 4)

An overview of all 96 well, 384 well and 1536 well microplates listed in this catalogue can be found in the Technical Appendix → p. A | 3 ff.

For further information on microplates from Greiner Bio-One (e.g. quality aspects, dimensions, application notes), please visit the HTS Know-How Platform on our website: www.gbo.com/bioscience/hts

96 Well Microplates

Since its introduction in the 1960's applications for the 96 well microplate have continually increased to the extent that it is impossible to envisage modern research and industry without it today. Greiner Bio-One has been manufacturing microplates and strip microplates for diagnostics and immunological

research for over 30 years. A large number of different 96 well microplates is available in a wide variety of surface treatments. The spectrum ranges from clear bottom microplates and completely black or white microplates to UV-Star® products.

96 Well Polystyrene Microplates

96 well polystyrene microplates are available in the following versions:

- Sterile or non sterile
- Cell culture treated (→ p. 1 | 12 ff.)
- In medium binding or high binding quality (→ p. 3 | 5)
- In non-binding quality (→ p. 2 | 31)
- With or without lid

Well Profile

The well profile is a critical aspect in a 96 well microplate. Different well shapes are available for each application (Fig. 1 – Fig. 4):

U-Bottom

The “U” describes the round bottom shape (Fig. 1). U-bottom microplates are ideally suited for agglutination tests.

- No sharp corners to facilitate easy and residue-free pipetting
- Suitable for +/- analyses

Figure 1:
Well profile: 96 well U-bottom, polystyrene
Total volume: 323 µl
Working volume: 40 – 280 µl

V-Bottom

The “V” stands for the conically tapered well bottom (Fig. 2). These microplates are ideally suited for applications in which the entire sample volume must be pipetted off.

- For precise pipetting
- Ideally suited for the storage of samples
- Suitable for +/- analyses

Figure 2:
Well profile: 96 well V-bottom, polystyrene
Total volume: 234 µl
Working volume: 40 – 200 µl

F-Bottom / Standard (ST)

The “F” refers to the flat well bottom (Fig. 3). This well type is ideal for precise optical measurements. The measuring light source is not deflected by the well profile.

- Excellent optical properties
- For precise optical measurements
- For microscopic applications (bottom reading)

Figure 3:
Well profile: 96 well F-bottom / ST, polystyrene
Total volume: 382 µl
Working volume: 25 – 340 µl
Growth area: 32 mm²

F-Bottom / Chimney Well

The standard flat bottom microplate (Fig. 3) has the same well profile as the chimney well microplate (Fig. 4). The difference from the standard plate is the chimney-like arrangement of the wells. Each well stands on its own (Fig. 5). Therefore the risk of sample carryover and cross contamination is minimised.

Figure 4:
Well profile: 96 well F-bottom / chimney well, polystyrene
Total volume: 392 µl
Working volume: 25 – 340 µl
Growth area: 34 mm²

Figure 5:

96 Well Half Area Polystyrene Microplates

For many applications in the laboratory, a reduction of the sample volume is an important criterion. For pharmaceutical drug screening, the simplest way of reducing the sample volume is to use high-format microplates, such as the 384 well or 1536 well microplates. However, many research groups in the development field or companies in the field of ELISA diagnostics shy away from changing to high-format plates, due to the automation that this entails. The 96 well half area microplates offer an interesting alternative here. They can be pipetted manually without any problem but at the same time allow a reduction of the sample volume by up to 50 %. The 96 well half area microplates are available as black, white, clear and µClear® microplates in ELISA, HTS and cell culture quality.

Well profile (Fig. 6)

96 Well Polypropylene Microplates

Polypropylene (PP) has low biomolecular binding characteristics, a high temperature tolerance, and is resistant to many standard laboratory chemicals, such as DMSO.

From black polypropylene microplates for fluorescence polarisation to white microplates for scintillation proximity assays (SPA), the 96 well polypropylene range has all you need.

96 well polypropylene microplates are available in the following versions:

- Sterile
- Non-sterile
- Natural, black or white version
- Barcode-labelled on request (→ p. 14 | 4)

Polypropylene microplates are ideally suited for the following applications:

- Long-term storage of active agents
- Storage of DNA or RNA, stock cultures

384 Well Microplates

Drug screening has undergone rapid development over the past few years. The number of tests with new targets and the number of active agents to be tested is constantly increasing. Volume reduction, simple testing and cost savings are some of the highest priorities and high format microplates with a low well volume are one of the most important tools in achieving this. One of the first higher format microplates was the 384 well plate, launched by Greiner Bio-One in 1994/1995. Compared with the 96 well standard microplate, the number of wells is quadrupled in this microplate, combined with a volume

reduction from 382 µl to 131 µl. The well-to-well spacing is 4.5 mm (96 well plate: 9 mm). The external dimensions of the 384 well microplates are compatible with standard equipment and automated systems. The 384 well microplates are available as black and white clear bottom plates (µClear®), in FLUOTRAC™, LUMITRAC™, MICROLON®, CELLSTAR®, UV-Star® or non-binding quality.

384 Well Polystyrene Microplates

384 well microplates are available in the following versions:

- Sterile or non sterile
- Cell culture treated (→ p. 1 | 16 ff.)
- In medium binding or high binding quality
- In non-binding quality (→ p. 2 | 32)
- In UV-Star® quality (→ p. 2 | 37)
- With or without lid
- Barcode-labelled on request (→ p. 14 | 4)

Improved Rounded Square Well Design

All wells of the 384 well microplates, with the exception of the 384 well Small Volume™ microplate, are rounded square wells, i.e. they are square with rounded corners (Fig. 2). This design combines the advantages of the square well, i.e. flexible working volume of 15 – 110 µl, with the advantages of a round well, such as reduced wicking and bubbling.

Figure 1:
Well profile: 384 well, polystyrene
Total volume: 131 µl
Working volume: 15 – 110 µl
Growth area: 10 mm²

Figure 2:

384 Well Small Volume™ LoBase and HiBase Polystyrene Microplates

A small sample volume is an important goal in high-throughput screening. The substances to be tested and the reagents used are usually scarce, expensive and time-consuming to produce. In addition to a high degree of automation and the use of sensitive reader systems, the introduction of higher format microplates, such as the 384 well or the 1536 well microplate, has made a decisive contribution to reducing the sample volume.

The potential for savings in the 384 well microplate with an average working volume of 70 – 80 µl is relatively limited and successful use of 1536 well microplates requires considerable optimisation work on the instrumentation to be used. In order to enable a savings potential in the 384 well format comparable to a 1536 well microplate, Greiner Bio-One developed a new platform with the 384 well Small Volume™ microplates. They have round wells with a conical geometry (Fig. 1 and Fig. 2). The wells have a total volume of 28 µl and a working volume of between 4 µl and 25 µl. Two different 384 well Small Volume™ microplate versions are available:

384 well Small Volume™ HiBase polystyrene microplates:

- Perfect for top reading even at low working volumes
- Savings in reagent similar to 1536 well microplates
- Suited for transmission, fluorescence and luminescence applications
- Excellent optical properties
- Available in med. binding or high binding quality (MICROLON®, FLUOTRAC™, LUMITRAC™)
- Available cell culture treated (→ p. 1 | 17)
- Available in non-binding quality (→ p. 2 | 32)

384 well Small Volume™ LoBase polystyrene microplates:

- Perfect for bottom reading even at low working volumes
- Savings in reagent similar to 1536 well microplates
- Suited for transmission, fluorescence and luminescence applications
- Excellent optical properties
- Available cell culture treated (→ p. 1 | 17)
- Available in med. binding or high binding quality

384 Deep Well Small Volume™ Polypropylene Microplate

The 384 Deep Well Small Volume™ polypropylene microplate offers new possibilities for drug discovery:

- Standardised plate geometry (conform to ANSI 1-2004)
- Large working volume from 1 µl to 90 µl (Fig. 1)
- Dead volume below 1 µl
- Focused liquid samples (Fig. 2)
- No loss of valuable compounds

Figure 1:
Well profile: 384 Deep Well Small Volume™
Total volume: 107 µl (21 µl in the frustrum)
Working volume: 1 – 90 µl

Figure 2: Location of liquid at the bottom of different microplate wells

The 384 Deep Well Small Volume™ polypropylene microplate is especially suited

- For direct compound transfer and preparation of assay-ready plates:**
The focused aggregation of even small sample volumes in the well centres (Fig. 2) allows the transfer of small amounts of highly concentrated compound solutions with pin tools or capillary-based liquid handling systems. Direct compound transfer of 50 nl from storage to assay plate is possible and pre-dilution of concentrated compounds becomes redundant.
- For pre-dilutions:**
If pre-dilution of compounds is required by the application, e.g. for sensitive cell-based assays, the working volume of 90 µl allows a high dilution under the cell toxicity level of DMSO.
- As storage plate:**
Polypropylene, the base polymer of the 384 Deep Well Small Volume™ microplate has low binding characteristics, a high temperature tolerance, and is resistant to many standard laboratory chemicals, such as DMSO.
- For sealing:**
The square well geometry at the top of the wells with pronounced sealing rims facilitates heat sealing.
- For automation:**
The standardised microplate footprint and well geometry enables efficient integration with automated systems.

1536 Well Microplates

The highest possible degree of automation, optimal performance and cost savings continue to be the requirements placed on microplates for high-throughput screening. In 1997, shortly after the launch of the 384 well microplates, Greiner Bio-One was the first manufacturer to introduce another innovative microplate format – the 1536 well microplate. The external dimensions were the same as those used in the 96 well and 384 well microplates. However, to utilise the available space most efficiently, the number of wells was increased fourfold from 384 to 1536.

Close cooperation with numerous users has now led to the development of a broad product range, and the constant drive towards improvements in quality has, for example, led to a reduction in curvature of the plates to < 100 µm. The 1536 well microplates are available as clear bottom variants, in clear polystyrene and completely black or white in CELLSTAR®, LUMITRAC™, FLUOTRAC™ and non-binding quality. The product range has been further expanded by a 1536 Deep Well polypropylene microplate (→ p. 2 | 27).

1536 Well Polystyrene Microplates

1536 well polystyrene microplates are available in the following versions:

- Sterile
- Non-sterile
- Cell culture treated (→ p. 1 | 18 f.)
- In medium binding or high binding quality
- With or without lid

1536 Well LoBase and HiBase Microplates

Two versions of the 1536 well microplates have been developed, the LoBase version and the HiBase version. In both versions, the total well volume is 12.6 µl, with a working volume of 3 – 10 µl.

Figure 1:
Well profile: 1536 well, LoBase
Total volume: 12.6 µl
Working volume: 3 – 10 µl
Growth area: 2.3 mm²

1536 well LoBase microplates (Fig. 1):

- Ideally suited for bottom reading even at low working volumes
- Suited for transmission, fluorescence and luminescence applications
- Excellent optical properties

1536 well HiBase microplates (Fig. 2):

- Ideally suited for top reading even at low working volumes
- Suited for transmission, fluorescence and luminescence applications
- Excellent optical properties

Figure 2:
Well profile: 1536 well, HiBase
Total volume: 12.6 µl
Working volume: 3 – 10 µl
Growth area: 2.3 mm²

All wells of the 1536 well microplates are rounded square wells, i.e. they are square with rounded corners (Fig. 3). This design combines the advantages of the square well, i.e. a flexible working volume of 3 – 10 µl with the advantages of a round well, such as reduced wicking and bubbling.

Figure 3:
The rounded square well design

Storage Plates

Greiner Bio-One polypropylene microplates are perfect storage plates for active agents, patient samples or biomolecules. Their most important properties are biological inertness, resistance to numerous solvents commonly used in the laboratory, such as DMSO and temperature resistance from -196 °C to +121 °C.

The footprint is compatible with automated systems. The microplates are also characterised by elevated well walls which make it possible to easily seal them.

➤ Further 96 well polypropylene microplates can be found on p. 2 | 10

➤ Compound storage microplates can be found on p. 2 | 28

96 Well Storage Box

The Greiner Bio-One storage box system in microplate format meets all requirements. It comes with a coding card, which enables proper storage of samples, and the temperature resistance of the polypropylene vessels from -80 °C to +121 °C provides for a broad range of applications. All components of the storage box are autoclavable. The box has space for 96 vessels with a capacity of 1.3 ml each.

The individual vessels are made of biologically inert polypropylene, while the storage box itself is made of polycarbonate (PC). The storage box comes with a lid, ID-card and with/without 96 PP-vessels with mounted adhesive strips, and can be supplied both sterile and non-sterile.

384 Deep Well Polypropylene MASTERBLOCK®

In addition to the 384 well polypropylene microplates with F-bottom and V-bottom, a 384 well MASTERBLOCK® extends the range of polypropylene microplates. The innovative design of the Deep Well MASTERBLOCK® enables numerous applications in which larger volumes are required. The MASTERBLOCK® is ideal for compound libraries and the storage of samples in general. The conical shape of the wells (Fig. 1 and 2) enables precise pipetting down to the last drop. The standardised external dimensions and the tight tolerances make liquid handling easier for robotics. The MASTERBLOCK® is also available barcode-labelled on request (→ p. 14 | 4).

Compound Storage Microplates

384 Well and 1536 Well Microplates for Compound Storage

Polypropylene is still the material of choice for storage plates, but the material class of cycloolefins is becoming more routinely used because of its unsurpassed performance for a wide range of applications. In compound storage, plates made from cycloolefins offer the best combination of chemical resistance to polar solvents, like DMSO, and optical clarity. In addition, the dimensional stability and glass-like optical properties make this material ideally suited for plates in fully automated systems. (Detailed listing of the physical properties of cycloolefins → Technical Appendix).

- Microplates made from cycloolefin offer the following advantages in compound storage:
- Resistant against polar solvents such as DMSO and alcohols
 - Excellent water and vapour barrier function to minimise evaporation
 - Nearly no extractables minimise leaching to avoid compound contamination
 - Low biomolecule binding reduces the loss of compounds in storage and screening assays
 - Glass-like optical properties for sensitive transmission and fluorescence measurements
 - Superior mechanical stability and bottom thickness uniformity

384 Well Polypropylene Storage Plate

Figure 1:
Well profile: 384 well polypropylene storage plate
Total volume: 152 µl
Working volume: 15 – 145 µl

The 384 well polypropylene microplates are the classic storage plates. They can be easily sealed using commercially available heat-sealers and bind negligible amounts of proteins or active substances (Fig. 1).

384 Well Small Volume™ Cycloolefin Storage Plate

Figure 2:
Well profile: 384 well Small Volume™ cycloolefin storage plate

The new 384 well Small Volume™ cycloolefin microplate reduces the dead volume in compound storage. (Fig. 2).

1536 Well Cycloolefin Storage Plate

**Figure 3:**

Well profile: 1536 well cycloolefin storage plate

Total volume: 12 μ lWorking volume: 1 – 10 μ l

The new 1536 well cycloolefin storage plate allows the storage of non-human sample material in the 1536 well format and reduces the dead volume in compound storage. With a working volume of 1 – 10 μ l this microplate is ideal for working with minimal sample volumes (Fig. 3).

1536 Well Cycloolefin Storage Plate with Optimised Geometry for Low Evaporation

**Figure 4:**

Well profile: 1536 well cycloolefin storage plate with optimised geometry and lid

Total volume: 16 μ lWorking volume: 1 – 14 μ l

The 1536 well cycloolefin storage plate with optimised geometry was developed in collaboration with Novartis AG, Basel, CH. The microplate features a continuous groove around the edges of the plate, in which a matching cycloolefin plate lid fits (Fig. 4). This prevents evaporation and minimises edge effects.

Non-binding Microplates

Microplates with Non-Binding Surface Properties for Biochemical Assays

High quality microplates with well-defined properties are essential prerequisites for reproducible results in advanced drug discovery. In addition to format and pigmentation, determining the best microplate surface for use within a specific application is a critical factor for successful high-throughput screening.

Polystyrene microplates with medium binding surfaces are commonly used for homogeneous biochemical HTS assays. Manufactured of carefully selected raw material batches, medium binding microplates demonstrate low reproducible biomolecule binding. As medium binding microplate surfaces are not physically modified, their surface characteristics are representative of pure polystyrene.

However, even low amounts of biomolecular binding (e.g. DNA, RNA, proteins, peptides) can cause an undesirable increase in background, resulting in decreased signal-to-noise ratio. Greiner Bio-One's non-binding microplate surfaces prevent unwanted non-specific binding, especially advantageous for sensitive biochemical assays.

Characterised by low protein, DNA, RNA and peptide binding properties (Fig. 1, Fig. 2) the new non-binding surfaces significantly increase assay sensitivity by reducing background and improving signal-to-noise ratio (Fig. 3).

Figure 1:
Peptide binding (5.8 kDa) on different surfaces

Figure 2:
Technology of the non-binding surface.
The hydrate layer, created by covalently linked functional groups, enables biomolecules to remain in solution, thereby preventing their binding to the surface.

Non-binding surfaces from Greiner Bio-One are achieved through a stable chemical modification to covalently link functional groups with the base polystyrene polymer. Under aqueous assay conditions a hydrate layer forms, preventing dissolved biomolecules from binding to the microplate surface (Fig. 2). As the non-binding surface is stable under common assay conditions (Fig. 4), there is no potential for degradation or leaching and resultant assay interference.

Figure 3:
Z-factor of a biochemical assay (Perkin Elmer TruPoint™ Caspase-6 assay). Comparison of non-binding versus polypropylene microplates. (The z-factor defines the precision of an assay; a factor of 1 represents the highest precision possible.) [1]

Figure 4:
Background signal using Quanti-iT™ Protein Detection Kit from Molecular Probes (Cat.-No. Q33210). The dye of the Quant-iT™ kit stains proteins as well as detergents. In the absence of protein, a high fluorescence signal indicates the presence of high amounts of dissolved detergents that have leached from the vessel surface.

Non-binding microplates are featured in 96, 384 and 1536 well formats in black, white and clear, including solid and µClear® film well bottoms.

- Characteristic features of the non-binding surface are:
- Ultra low non-specific biomolecular binding properties (proteins, DNA, RNA)
 - Long-term surface stability without degradation or leaching
 - Higher assay sensitivity with reduced background

Streptavidin-coated Microplates

Streptavidin-coated solid phases serve as reliable binding surfaces for all types of biotinylated molecules. Numerous ligands can be biotinylated simply and due to the low molecular weight of biotin (244 Da) the functionality of the molecules is normally not impaired.

Thus streptavidin-coated solid phases make it possible to rapidly isolate, determine and quantify components from a reaction mixture. By immobilising the biotinylated substance, it is also possible to reproduce complete reaction chains on a streptavidin solid phase, e.g. enzyme immunoassays, enzyme activity assays, DNA hybridisation techniques, quantification of PCR products and receptor/ligand studies. The high-purity streptavidin is bound to the plate surface in a uniform and stable layer.

The coefficient of variation from well to well is under 5 % for 96 well microplates and under 8 % for 384 microplates.

	96 Well Microplate	384 Well Microplate
Streptavidin-coating (in relation to volume)	300 µl	90 µl
Biotin binding capacity ^{*)}	> 5 ng/well or > 20 pmol/well	> 1.5 ng/well or > 6 pmol/well

^{*)} Biotin binding capacity determined by competition test

The streptavidin solid phase is treated with an additional blocking step in order to minimise any unspecific binding, therefore, „pre-blocking“ of plates is not necessary. The high stability of the coating and the high affinity between streptavidin and biotin enables unusually stringent washing conditions, which have a positive effect on the signal-to-noise ratio of the measurement.

- Shelf-life: 3 years at room temperature
- Pre-blocking: All plates are pre-blocked and ready-to-use

SensoPlate™

Glass Bottom Microplates

The research of biomolecular processes on the level of single molecules and in volume ranges equivalent to the size of a single bacterium is of immense importance, both in basic research and in industrial high-throughput screening. The combination of modern confocal optics, new fluorescent dyes, sensitive photomultipliers and improved data processing has revolutionised the technique of fluorescence correlation spectroscopy (FCS) (Fig. 1). Over the past few years this has led to its widespread application, and alongside the technological advances in hardware development, Greiner Bio-One worked hand-in-hand with customers and instrument suppliers to develop the glass bottom microplates. These better satisfy the requirements of fluorescence correlation spectroscopy with regard to optical clarity and deformation when compared to standard polystyrene plates.

Figure 1:
The principles of fluorescence correlation spectroscopy

The **SensoPlate™** family was developed in a complete product line consisting of 24, 96, 384 and 1536 well glass bottom formats. All plates consist of an optically clear borosilicate glass bottom with a light path of 175 +/- 15 µm and a black polystyrene frame. The glass bottom allows transmission measurements in the wavelength range above 350 nm. For mounting the glass bottom plates an adhesive with the lowest possible autofluorescence is used.

In addition to fluorescence correlation spectroscopy, microscopic applications such as confocal microscopy are a potential area of application for glass bottom microplates. The 175 µm thick glass bottom of the **SensoPlate™** is equivalent to the light path of standard coverslips. The **SensoPlate™** family is available sterile with lid but should be tested for their suitability for cell culture before application. For sensitive or transformed cell lines pre-coating with an extracellular matrix such as Poly-Lysine or Collagen is recommended. 4 % formaldehyde is recommended for fixing cells.

The footprint of all glass bottom microplates is conform to the ANSI 1-2004 standard (Fig. 2). For further information please visit our website: www.gbo.com/bioscience/technical_information.

Figure 2:
Footprint and tolerances of SensoPlate™ and SensoPlate™ Plus

In-process-controls and constant quality monitoring ensures minimum surface deformation (< 0.1 mm).

The **SensoPlate™ Plus** glass bottom microplates were developed in collaboration with Evotec Technologies GmbH for optical applications in High-Content Screening. They are characterised by an improved geometry, which enables interference-free measurements and also microscopy over the whole surface of the bottom of a microplate (Fig. 3 and 4). The short distance of 0.3 mm between the external well bottom (underside) and microplate skirt bottom facilitates changing objectives during microscopy and imaging perimeter wells without hindrance. The **SensoPlate™ Plus** is available non-sterile without lid in 384 well and 1536 well format.

UV-Star® Microplates

UV/VIS spectroscopy is a classical analytical method for determining the chemical constitution of a substance and its concentration in aqueous solution. UV/VIS spectroscopy is usually conducted in quartz glass cuvettes. However, cuvettes do not provide sufficient throughput when dealing with large amounts of samples, and microplates can be used to speed up work.

Standard polystyrene microplates are only partially suitable for transmission measurements in the UV. Polystyrene absorbs UV especially in the short-wavelength range (< 320 nm). µClear® microplates with a thin polystyrene film base already have much lower background values and can be used up to 340 nm without any problem. The adaptation of the patented µClear® process technology to a new, innovative UV-transparent material has made it possible to produce microplates that extend the transmission range up to 230 nm (Fig. 1).

Figure 1: Light transmission of UV-Star® and µClear® microplates compared with a conventional microplate

For the determination of nucleic acid and protein concentrations at 260 nm or 280 nm without background interference UV-Star® microplates are the ideal alternative to expensive and fragile quartz glass plates or cuvettes. UV-Star® plates are also DMSO-resistant and can be stored at -20 °C without any problem.

In accordance with Lambert Beer's Law, the amount of absorbed light in a sample is proportional to the concentration and layer thickness (i.e. pathlength) of the substance to be measured (Fig. 2).

Figure 2: Lambert Beer's Law. Fixed pathlength in a cuvette (a) compared to a variable pathlength in a microplate well (b).

In classical spectral photometry with quartz glass cuvettes, measurement is made horizontally with a set pathlength of usually 1 cm. Given a known coefficient of extinction and a standardised distance of travel, the concentration of a substance can be determined without standards, although a large amount of sample is required to completely fill a cuvette. After measurement, the sample measured is only of limited further use as a result of the risk of contamination. In the case of concentration determinations in microplates, the measurement is made vertically and the layer thickness of the sample to be measured is dependent on the sample volume (Fig. 2). Even with smaller sample volumes, the resulting layer thicknesses are sufficient for precise measurement. At a constant sample volume, concentrations can be determined with the aid of a calibration curve. In the case of a varying sample volume, the layer thickness can either be calculated mathematically (→ Technical Appendix) or determined optically taking into account the absorption of water in the infrared range [1].

Immunology

ELISA (Enzyme-Linked Immunosorbent Assay) is probably the most widely used biochemical method in laboratory analysis and diagnostics. Analytes such as peptides, proteins, antibodies and hormones can be detected selectively in low concentrations among a multitude of other substances and be quantified. Additionally, ELISAs are rapid, sensitive, cost-effective and can be performed in a high-throughput manner.

ELISA is used in a variety of different assay types (e.g. direct ELISA, indirect ELISA, sandwich ELISA, competitive ELISA). Nevertheless, all ELISA variants are based on the same principle, the binding of one assay component – antigen or specific antibody – to a solid surface and the selective interaction between both assay components. Molecules not specifically interacting with the assay component bound to the solid surface are washed away during the assay.

For detection of the interaction the antibody or antigen is labelled or linked to an enzyme (direct ELISA; Fig. 1). Alternatively, a secondary antibody conjugate can be used (indirect ELISA; Fig. 2). The assay is processed by adding an enzymatic substrate to produce a measurable signal (colorimetric, fluorescent or luminescent). The strength of the signal indicates the quantity of analytes in the sample.

Figure 1: Direct ELISA

Figure 2: Indirect ELISA

Surface Properties and Microplate Colour

A key step in ELISA is the binding of one assay component – antigen or antibody – to the solid surface by passive adsorption. Therefore, the features of this surface are crucial for the performance of the assay. All ELISA microplates from Greiner Bio-One are made out of high-quality virgin polystyrene. The resin is highly transparent and therefore ideally suited for optical measurements. Due to its chemical nature polystyrene is a hydrophobic compound. Hydrophilic groups can be introduced to polystyrene surfaces by physical treatment. Greiner Bio-One offers two surface qualities for ELISA microplates: the hydrophilic **high binding** products and the less hydrophilic **medium binding** products.

Since attachment to a solid surface based upon passive adsorption depends as well on the properties of the molecule to be bound, it is therefore advisable to compare the performance of high binding and medium binding products when developing a new assay.

Beside products made of clear polystyrene for colorimetric measurements, Greiner Bio-One offers a wide variety of black and white ELISA microplates for luminescence and fluorescence measurements. Colour and surface properties can be deduced from the respective brand name of our products (Table 1).

Brand name	Surface property	Colour
MICROLON® 200	Medium binding	clear
MICROLON® 600	High binding	clear
FLUOTRAC™ 200	Medium binding	black
FLUOTRAC™ 600	High binding	black
LUMITRAC™ 200	Medium binding	white
LUMITRAC™ 600	High binding	white

Table 1: Assignment of brand names and properties of ELISA microplates

Quality aspects

We set high standards on the quality of our immunological products, especially on consistency and reproducibility of binding properties. As the raw material has a major influence on the binding properties of the final product, the incoming raw material used for ELISA microplates is routinely monitored for identity and immunological quality. Sample plates are tested with an immunoassay (ELISA, LIA or FIA, depending on their applications) and must fulfil the following criteria:

- For intra-plate homogeneity the coefficient of variation (CV) must not exceed 5 % for colorimetric or 10 % for fluorescence and luminescence assays.
- For all immunological products, to provide constant binding properties, the CV for five tested plates must not exceed 10 %. Additionally, the ratio of new sample plates to reference plates has to be in the range of 100 +/-10 %.

The main criterion for our ELISA microplates is a stable coefficient of variation (CV) from batch to batch which is monitored over a long period (Fig. 3).

Figure 3: Coefficient of variation (CV) of tested raw material batches from 2007 to 2011 for transparent microplates (med. and high binding)

If the criteria have been met, the raw material batch is approved and released for the production of ELISA microplates.

This raw material batch is also documented on the package labelling of the end product. The package labelling of our ELISA microplates is as follows:

The number of the raw material batch used can be found on the package box, alongside the shelf life, the lot number, a consecutive box number and an in-process control number (Fig. 4).

Figure 4: Package labelling of immunological products

96 Well ELISA Microplates

Greiner Bio-One has been manufacturing microplates for diagnostics and immunological research for over 30 years. A wide variety of microplates with different surface treatments is available. The spectrum ranges from clear bottom microplates and completely black or white microplates to UV-Star® products. The microplate footprint is compatible with automated systems.

!

96 Well ELISA Strip Plates

Figure 1:
Overview of the microplates available in strip format

Microplates in strip format offer the advantage of greater flexibility in diagnostics. Individual strips can be removed from the support frame so that the number of tests to be performed can be adjusted to the number of samples, and is not predetermined by the microplate format used. In addition, the individual strips of a microplate can be subjected to a wide variety of different test conditions. An overview of the available microplates in strip format is provided in Fig. 1.

Well Profile

Detailed information about wetted surface and surface/volume ratios
→ Technical Appendix p. A I 21 f.

1. C-Bottom SB (Single-break) Strip Plates

The “C” describes a flat-bottom profile with rounded corners (Fig. 2). The rounded corners mean that the individual wells can be pipetted without leaving a residue, and the flat bottom still enables precise optical measurements. C-bottom SB strips are supplied as twelve 8 well strips, in a support frame with 96 spaces (12 x 8 matrix). The individual wells can be broken off separately (“single-break” option) and the number of tests performed can thus be precisely adjusted to the number of samples. C-bottom SB strip plates are available in clear polystyrene and additionally with a red, green, blue or yellow colour coding on the well rim.

Figure 2:
Well profile: C-bottom
Total volume: 346 µl
Working volume: 20 - 300 µl

2. U-Bottom Strip Plates

96 well strip plates with a round bottom (U-bottom, Fig. 3) are available as both 8 well and 16 well strips. The “U” describes the round bottom form. U-bottom strip plates are ideally suited for agglutination tests.

- No corners, therefore simple and clean pipetting
- Suitable for +/- analyses

Figure 3:
Well profile: U-bottom
Total volume: 312 µl
Working volume: 50 - 280 µl

3. F-Bottom Strip Plates

96 well strip plates with a flat bottom (F-bottom, Fig. 4) are available

- as 8 well strips
- as 12 well strips
- as 16 well strips

The “F” stands for the flat bottom of the wells. This well type is ideal for the most precise optical measurements as the measuring light beam is not deflected by the well profile. F-bottom strip plates are available in clear polystyrene (MICROLON®) and additionally in black (FLUOTRAC™) and white (LUMITRAC™).

Figure 4:
Well profile: F-bottom
Total volume: 388 µl
Working volume: 20 - 350 µl

Immuno Tubes

Immuno Tubes

- ▶ Tubes p. 5 | 3 ff.
- ▶ Cell Culture Tubes p. 1 | 21

- Manufactured from crystal clear polystyrene

Immuno tubes are often used for determining hormone levels, for example TSH (thyroid stimulating hormone). With a length of 75 mm and a diameter of 12 mm with and without a “star”, they are available in both MICROLON® 200 and MICROLON® 600 quality.

The so-called “star” at the bottom of the tubes serves to increase the surface and thus makes it possible to bind larger amounts of antigens or antibodies.

Terasaki Plates

60 Well and 72 Well Terasaki Plates

Terasaki Plates

Microscopic coverslip for Terasaki plates
Cat.-No. 653 081

Micro Dispenser for 60 well Terasaki plates
available on request

- Manufactured from crystal clear polystyrene

Terasaki Plates

The human leucocyte antigen (HLA) system is the major histocompatibility complex (MHC) of humans and is composed of the two polymorphic classes HLA-I (A, B, and C) and HLA-II (DR, DQ, and DP). Basically, four different areas of indication can be distinguished for HLA typing:

- Transplantation
- Transfusion
- Disease association
- Forensic

The serological determination of HLA proteins of the HLA-A, -B, -C and -DR genetic positions is primarily performed with the complement-dependent microlymphocytotoxicity test (LCT) or Terasaki test, which has been standardised since 1964. The basis for this test method is the cytolysis of the lymphocytes

to be tested, which is caused by the antibody-antigen mediated activation of the complement system. Permeabilised lymphocytes are generally stained with chromophores or fluorophores and evaluated microscopically.

Greiner Bio-One Terasaki plates are suitable for all applications for serological determination of HLA antigens. The plates are supplied either with 60 or 72 wells, the plate dimensions stay the same. The individual wells have a volume of 10 µl.

Cat.-No. 659 180 contains one lid per bag.

We provide Terasaki plates with 1 years' stability on the surface treatment.

Cat.-No.	653 180	653 190	659 180	659 190	654 180	769 190
