The New Generation of ESR Systems: Innovative Products for Faster Results

Dear **VACUETTE** Customer,

The centralised laboratory implementation of erythrocyte sedimentation analyses forms a solid basis for medical decisions. For this, high-quality, fully automatically controlled ESR devices are needed to enable efficient planning of workflows.

The new generation of **VACUETTE**® ESR systems offers a significant advantage – you save time!

1 hour Westergren value after just 15 or 30 minutes.

After just 15 minutes, the analysis result for the 1 hour Westergren value is available. Alternatively you can still choose to call up the 30 minute value, like before. The correlation factor of both values is virtually identical. Furthermore, the 2 hour Westergren value is available after only 60 minutes.

A study comparing both values confirms this result. You can find this comparative study under the following [link](#) on our website.

The design of the device is yet another change. The new **VACUETTE®** ESR instruments are provided in a blue design for visual differentiation.

There is no change to random insertion of tubes: with the new generation of devices, the **VACUETTE®** ESR tubes can still be inserted as required even when an analysis is running. The separate measurement of each individual tube does not result in a time delay. The closed system makes the analysis hygienic and safe.

The ESR systems are available under the following item numbers:

Item N°	Description	Suitable for
836580	Sed Rate Screener (SRS) 100/II	100 tubes
836587	Sed Rate Screener (SRS) 20/II	20 tubes

You can download or order the following brochures from us:

Item N°	Description	Language	Links
980081	VACUETTE® Automated ESR Systems	German	Download
980082	VACUETTE® Automated ESR Systems	English	Download

You will find further information on our [website](#) or via e-mail to our responsible product manager Thomas Ehrenfellner – thomas.ehrenfellner@gbo.com.

Yours sincerely,
Greiner Bio-One
